INTRODUCTION	3
NEEDS/PROBLEMS	5
GOALS/OBJECTIVES.....	5
PROJECT TEAM AND THEIR RESPONSIBILITIES	6
PROJECT WIREFRAMES/SCREENS	7

Our project is focused on developing a comprehensive platform for Habib University, aimed at facilitating the booking of library spaces and various other rooms, including event halls, by both students and faculty members. The primary goal of this platform is to streamline the process of reserving spaces for academic and extracurricular activities, enhancing the overall campus experience for the university community.

The tech stack for this project is MERN, comprising:

- MongoDB as the database to store information related to rooms, bookings, and user profiles.
- Express and Node.js as the backend to handle server-side operations, APIs, and business logic.
- React for the frontend, providing a dynamic and responsive user interface for users to view, explore, and book spaces seamlessly.

Key features of the application include:

1. Space Information and Availability:

- Users (students and faculty) will have access to real-time information about various university spaces such as the Auditorium, Soorty Hall, classrooms, and study rooms.
- The platform will display the availability of these spaces, allowing users to check which spaces are free or already booked.

2. Room Booking:

- Students can book spaces for student-led events, study sessions, or other activities.
- Faculty members can reserve spaces for lectures, meetings, or university events.
- The booking system will have options for selecting date, time, and duration, ensuring the spaces are utilized efficiently and avoiding scheduling conflicts.

3. User-friendly Interface:

- The UI will be intuitive, making it simple for users to navigate through spaces, view details, and make bookings with minimal effort.
- The application will also feature an event calendar where users can track upcoming university or student-led events.

4. Notification System:

- Once a booking is confirmed, the system will notify users via email or in-app notifications.
- Users will also receive reminders about their upcoming reservations.

By creating a unified and efficient platform for managing campus spaces, this project aims to optimize the usage of Habib University's facilities, promote student and faculty engagement, and contribute to the overall functioning of the campus community.

Needs/Problems

10 Points

There is a need for a one-window platform for Habib University students where they can access university spaces, learn more about them, and book them for discussions, meetings, or events. Especially for library discussion rooms, students currently face difficulties as they cannot easily see when rooms are available for booking. This platform will serve as a one-stop solution, helping students navigate, book, and access university spaces seamlessly.

Additionally, this platform will eliminate the need for students to contact library staff or the Student Life department to book rooms, streamlining the process and removing the hassle of manual bookings. This will introduce a seamless user experience, allowing students to independently manage room bookings without administrative delays.

Goals/Objectives

5 Points

State the desired goals and objectives to address the needs/problems stated above. Also include key benefits of reaching goals/objectives.

- Create a centralized booking platform for university spaces

Goal: Develop a user-friendly platform where students can browse and book available spaces, such as discussion rooms, for meetings or events.

Measurable Outcome: By the end of development, the platform should allow students to view and book at least 90% of all available university spaces in real-time.

- Improve visibility of room availability

Goal: Implement a real-time availability feature that allows students to view when library discussion rooms and other spaces are free for use.

Measurable Outcome: Ensure that 100% of university rooms are updated in real-time, with students able to check room availability from anywhere on campus.

- Increase student engagement and ease of access

Goal: Make it easier for students to find, learn about, and access different spaces within the university.

Measurable Outcome: Achieve a 70% adoption rate among students within the first semester of the platform's launch, as measured by login statistics and room bookings.

Project Team and their responsibilities

5 Points

Team Member	Responsibility
Jibran	Developing the Front-end of the application, which involves making interactive UI, the wireframes.
Alizain and Wajeesh	Handling the Back-end, making APIS for accessing and managing data. Creating the database to store the data. Integrating the map in the application and use location to map users.

Project Wireframes/Screens

20 Points

You must develop 4-5 screens of your project and attach it here.

The wireframe shows a web browser window with a light blue header bar containing three dots. The main content area is white and features a 'Create new Account' form. On the left of the form is a pink rectangular placeholder labeled 'Add Text'. The form itself is centered and includes a link 'Already Registered? Login' above the input fields. The fields are labeled 'NAME', 'EMAIL', 'PASSWORD', and 'DATE OF BIRTH'. The 'NAME' field contains 'Jiara Martins', the 'EMAIL' field contains 'hello@reallygreatsite.com', and the 'PASSWORD' field contains six dots. The 'DATE OF BIRTH' field is a dropdown menu with 'Select' and a downward arrow. Below the form is a black 'sign up' button.
